Test Set Block Diagrams	111

This is a complete list of the technical specifications for the N5241A and N5242A network analyzer with the following options:

Option 029, adds hardware and firmware for high-accuracy noise figure measurements, utilizing source correction techniques. It requires one of the following options: 219, 224, 419, or 423. It also requires an N4691B ECal module for use as an impedance tuner, and a 346-series noise source for calibration. [See the block diagram.](#)

Option 200, 2-port standard test set (includes six front-panel access loops) and power range. [See the block diagram.](#)

Option 219, adds 2-port extended power range, source and receiver attenuators, and bias-tees (requires Option 200). [See the block diagram.](#)

Option 224, adds an internal second source, a combiner, and mechanical switches to the 2-port analyzer (requires Option 200, 219, and 080). [See the block diagram.](#)

Option 400, 4-port standard test set (includes twelve front-panel access loops), power range, and an internal second source (Option 080 recommended). [See the block diagram.](#)

Option 419, adds 4-port extended power range, source and receiver attenuators, and bias-tees (requires Option 400). [See the block diagram.](#)

Option 423, adds an internal combiner, and mechanical switches to the 4-port analyzer (requires Option 400, 419, and 080). [See the block diagram.](#)

Note

This document provides technical specifications for the 85052B calibration kit, the N4433A 4-Port ECal module, and the N4691B 2-Port ECal module. Definitions

All specifications and characteristics apply over a 25 °C $\pm$ 5 °C range (unless otherwise stated) and 90 minutes after the instrument has been turned on.

Specification (spec.): Warranted performance. Specifications include guardbands to account for the expected statistical performance distribution, measurement uncertainties, and changes in performance due to environmental conditions.

Characteristic (char.): A performance parameter that the product is expected to meet before it leaves the factory, but that is not verified in the field and is not covered by the product warranty. A characteristic includes the same guardbands as a specification.

Typical (typ.): Expected performance of an average unit which does not include guardbands. It is not covered by the product warranty.

Nominal (nom.): A general, descriptive term that does not imply a level of performance. It is not covered by the product warranty.

Calibration: The process of measuring known standards to characterize a network analyzer's systematic (repeatable) errors.

Corrected (residual): Indicates performance after error correction (calibration). It is determined by the quality of calibration standards and how well "known" they are, plus system repeatability, stability, and noise.

Uncorrected (raw): Indicates instrument performance without error correction. The uncorrected performance affects the stability of a calibration.

Standard: When referring to the analyzer, this includes no options unless noted otherwise.

Corrected System Performance

The specifications in this section apply for measurements made with the N5241A and N5242A analyzer with the following conditions:

- 10 Hz IF bandwidth
- No averaging applied to data
- Isolation calibration with an averaging factor of 8

20 GHz to 24 GHz	122	117	130	126
24 GHz to 26.5 GHz	112	109	124	120

1. The system dynamic range is calculated as the difference between the noise floor and the specified source maximum output power. The effective dynamic range must take measurement uncertainties and interfering signals into account.
2. Either port can be used as the source port. Any other port can be used as the receiver port.
3. May typically be degraded at particular frequencies below 500 MHz due to spurious receiver residuals.

16 GHz to 20 GHz	139	136
20 GHz to 24 GHz	134	129
24 GHz to 26.5 GHz	124	121

¹ The direct receiver access input extended dynamic range is calculated as the difference between the direct receiver access input noise floor and the source maximum output power. The effective dynamic range must take measurement uncertainties and interfering signals into account. This set-up should only be used when the receiver input will never exceed its maximum receiver input. When the analyzer is in segment sweep mode, it can have predefined frequency segments which will output a higher power level when the extended dynamic range is required (i.e. devices with high insertion loss), and reduced power when the maximum receiver input level will occur (i.e. devices with low insertion loss). The extended range is only available in one-path transmission measurements.

² Either port can be used as the source port. Any other port can be used as the receiver port.

³ May typically be degraded at particular frequencies below 500 MHz due to spurious receiver residuals.

¹ The direct receiver access input extended dynamic range is calculated as the difference between the direct receiver access input noise floor and the source maximum output power. The effective dynamic range must take measurement uncertainties and interfering signals into account. This set-up should only be used when the receiver input will never exceed its compression or damage level. When the analyzer is in segment sweep mode, it can have predefined frequency segments which will output a higher power level when the extended dynamic range is required (i.e. devices with high insertion loss), and reduced power when receiver compression or damage may occur (i.e. devices with low insertion loss). Note: For any S_{ii} reflection measurement:

- $S_{jj} = 0$.

For any S_{ij} transmission measurement:

- $S_{ji} = S_{ij}$ when $S_{ij} \leq 1$
- $S_{ji} = 1/S_{ij}$ when $S_{ij} > 1$
- $S_{kk} = 0$ for all k

² Dynamic accuracy is verified with the following measurements:

Compression over frequency

IF linearity at a single frequency of 1.195 GHz using a reference level of -20 dBm for an input power range of 0 to -120 dBm.

Table 28. Test Port Input (Group Delay)^a

Description	Typical Performance
Aperture (selectable)	(frequency span)/(number of points -1)
Maximum Aperture	20% of frequency span
Range	0.5 x (1/minimum aperture)
Maximum Delay	Limited to measuring no more than 180° of phase change within the minimum aperture.)
Accuracy	See graph below. Char.

The following graph shows characteristic group delay accuracy with full 2-port calibration and a 10 Hz IF bandwidth. Insertion loss is assumed to be < 2 dB and electrical length to be ten meters.

For any S_{ij} Group Delay measurement, $S_{ii} = 0$, $S_{ij} = 1$, $S_{ji} = 0$, $S_{kl} = 0$ for all $kl \neq ij$

Group Delay (Typical)

In general, the following formula can be used to determine the accuracy, in seconds, of specific group delay measurement:

$\pm \text{Phase Accuracy (deg)}/[360 \times \text{Aperture (Hz)}]$

Depending on the aperture and device length, the phase accuracy used is either incremental phase accuracy or worst-case phase accuracy.

^a Group delay is computed by measuring the phase change within a specified frequency step (determined by the frequency span and the number of points per sweep).

Specifications: N5241A and N5242A Option 029

General specifications apply to Option 029 with the port 1 noise tuner switch set to the internal position except as stated below. By default, the switch is set to the external position to ensure functional compatibility with existing PNA instruments. Refer to the Help System topic "Noise Figure Application" for information on setting the switch position.

Corrected System Performance with 3.5mm Connectors

Note: For any S_{ii} reflection measurement:

- $S_{jj} = 0$.

For any S_{ij} transmission measurement:

- $S_{ji} = S_{ij}$ when $S_{ij} \leq 1$
- $S_{ji} = 1/S_{ij}$ when $S_{ij} > 1$
- $S_{kk} = 0$ for all k

Table 46. N4691B 2- Port Electronic Calibration Module

N5241A and N5242A Option 029

Applies to the N5241A and N5242A analyzer with Option 029, an N4691B (3.5mm) electronic calibration module, an 85131F flexible test port cable set, and a full 2-port calibration. S-parameter measurements were made with the analyzer in the noise figure configuration. Environmental temperature 23° ±3 °C, with < 1 °C deviation from calibration temperature.

Figure 24. 2-Port N5241A and N5242A with Noise Figure Hardware (shown with Options 200, 219, 224, & 029).

On 4-Port analyzers (Option 419 or 423) with Option 029, ports 1 and 2 are the same as shown here.

- At test port 1 front panel loops, a noise tuner switch connects the noise tuner (ECal module) in series with Source 1, providing several different input impedances.
- At test port 2, a noise tuner switch and a coupler route the RF signal from the DUT output to two noise receivers. The appropriate receiver is automatically selected as required for the frequency being measured.

Remove all doubt

Our repair and calibration services will get your equipment back to you, performing like new, when promised. You will get full value out of your Agilent equipment throughout its lifetime. Your equipment will be serviced by Agilent-trained technicians using the latest factory calibration procedures, automated repair diagnostics and genuine parts. You will always have the utmost confidence in your measurements.

Agilent offers a wide range of additional expert test and measurement services for your equipment, including initial start-up assistance onsite education and training, as well as design, system integration, and project management.
