Innovation

ROHDE & SCHWARZ

R&S®ZVA Vector Network Analyzer

At a glance

The R&S®ZVA series is the high-end class of the Rohde & Schwarz network analyzers. It combines operating ease and high measurement speed uniformly implemented in the R&S®ZVA, R&S®ZVB, and R&S®ZVT with exceptional RF characteristics, a wide scope of functions, and high flexibility.

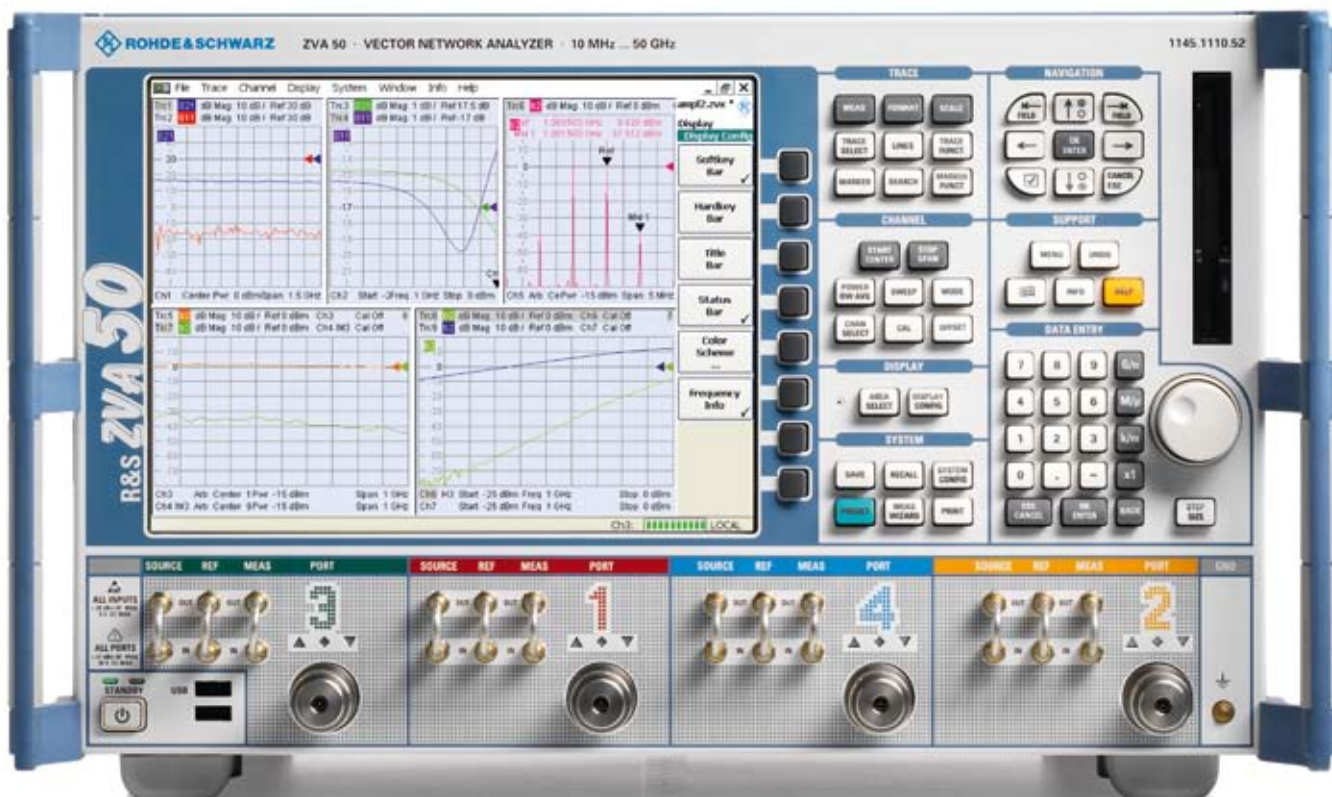

The R&S®ZVA series is an ideal choice for demanding measurements in the lab and in production – from filter measurements requiring maximum dynamic range to linear and nonlinear measurements on amplifiers, mixers, as well as receivers, transceivers, etc.

The R&S®ZVA has set milestones for the most challenging of applications:

- First VNA with two internal sources up to 50 GHz for fast two-tone measurements on amplifiers and mixers
- First VNA up to 50 GHz that generates phase-coherent signals
- First VNA with IF bandwidths up to 30 MHz for pulsed measurements on amplifiers and mixers up to 67 GHz

Key facts

- Linear and nonlinear amplifier and mixer measurements
- Noise figure measurements
- Pulse profile measurements with 12.5 ns resolution
- True differential measurements for reliable characterization of active devices with balanced ports
- High output power typ. > 15 dBm
- Wide dynamic range typ. > 140 dB
- High measurement speed < 3.5 μ s per test point
- Wide IF bandwidth: 1/5/30 MHz
- Versatile calibration techniques: TOSM, TRL/LRL, TOM, TRM, TNA, UOSM
- Automatic calibration units
- Mixer phase and group delay with and without LO access
- Frequency range: 300 kHz to 8 GHz (R&S®ZVA8); 10 MHz to 24/40/50/67 GHz (R&S®ZVA24/40/50/67)

R&S®ZVA Vector Network Analyzer

Benefits and key features

High measurement throughput

- Short measurement times due to fast synthesizers, wide IF bandwidths, and high dynamic range

▷ [page 5](#)

Ergonomic user interface

- More than 100 traces and channels
- Measurement wizard for easy setup of multiport and balanced measurements

▷ [page 7](#)

Easy and error-free calibration

- Versatile calibration techniques for test fixtures as well as for coaxial and on-wafer applications
- Automatic calibration with calibration unit

▷ [page 9](#)

Quick and reliable measurements on balanced components

- Virtual and true differential mode for linear and nonlinear tests of differential components

▷ [page 10](#)

Linear and nonlinear amplifier and mixer measurements

- Simultaneous measurement of noise figure and S-parameters
- Wide power sweep range for small and large signal analysis in one sweep
- Second internal source for fast hot S_{22} , IMD, and mixer measurements
- Phase and group delay measurements of the conversion loss on mixers and converters with and without LO access

▷ [page 11](#)

Options to enhance flexibility, power, and dynamic range

- Direct access to the generators and receivers for 30 dBm output power and 150 dB dynamic range
- Time domain with linear prediction for increased resolution

▷ [page 14](#)

Convenient handling of pulse profile measurements

- Easy setup of pulse-profile measurements with 12.5 ns time resolution and up to 30 MHz measurement bandwidth

▷ [page 16](#)

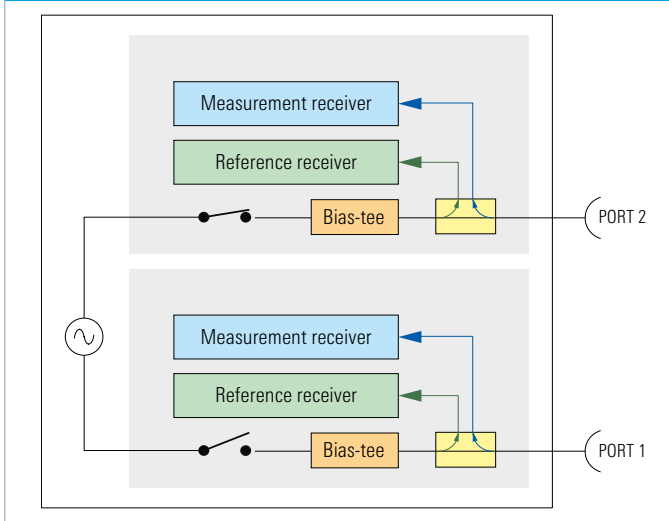

Measurements on active devices made easy

- Extension unit for the R&S®ZVA with integrated combiner, pulse modulators, and harmonic filters

▷ [page 17](#)

Introduction

Block diagram of the R&S®ZVA two-port model

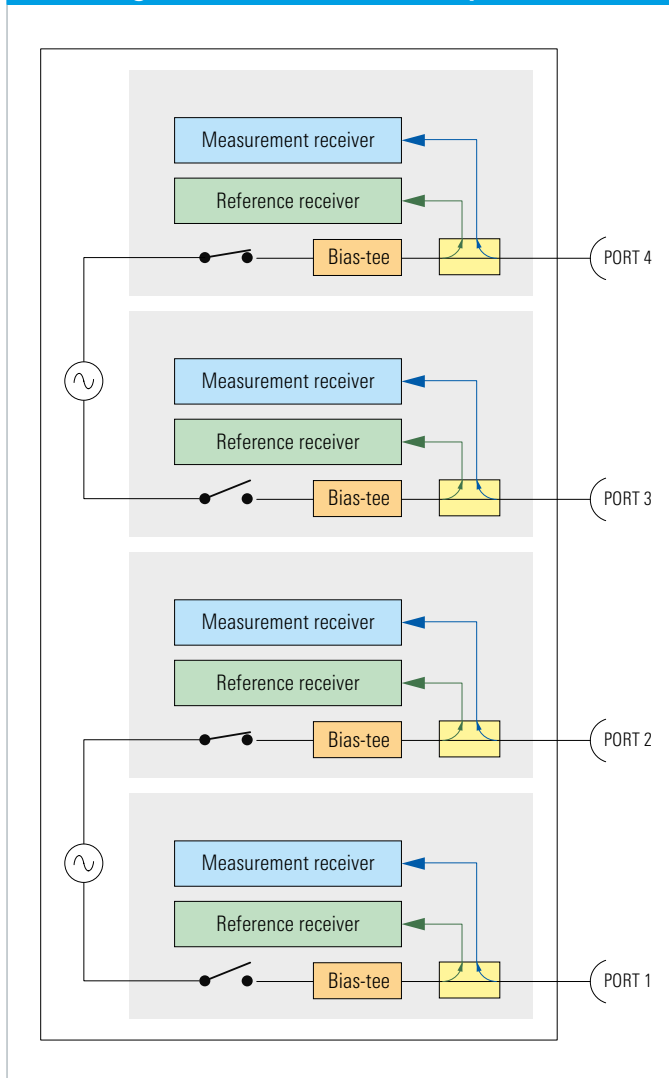

Technological progress in RF and microwave engineering means that network analyzers in development and production continuously have to meet new demands for ease of operation, flexibility, and performance.

With its new R&S®ZVA family of vector network analyzers, Rohde&Schwarz is taking a future-oriented approach. The analyzers offer a perfect balance between measurement speed, dynamic range, flexibility, and precision, making them ideal for present and future measurement tasks.

Rohde&Schwarz previously set standards in RF and microwave measurements with its R&S®ZVR family of network analyzers, and now continues this success with the R&S®ZVA. The fundamental mixing concept employed by the analyzer's receivers ensures high sensitivity and a wide dynamic range. Extremely fast synthesizers make for short measurement times.

Block diagram of the R&S®ZVA four-port model

Its excellent characteristics, new functionality, sophisticated GUI, and extremely high flexibility make the R&S®ZVA an indispensable tool for demanding measurement tasks in labs and production.

Test set design for enhanced performance and flexibility

The test set includes a number of special design features. There is one measurement channel and one reference channel for each test port, an RF switch in each generator path, and one generator for each pair of test ports. The two-port R&S®ZVA67 has even one generator for each test port. This makes the R&S®ZVA an analyzer of unprecedented performance and functionality, which is especially true for the four-port model:

- True differential measurements on balanced DUTs
- Two independent sources, e.g. for LO and RF signals for fast mixer or intermodulation measurements
- Parallel signal output and measurement at the test ports for measuring two or more DUTs simultaneously
- Direct generator/receiver access option to connect external test setups, e.g. power amplifiers, or use as a multichannel receiver, e.g. for antenna measurements

High measurement throughput

Wide dynamic range for fast and accurate measurements

The R&S®ZVA sets new standards in measurement speed. Its large IF bandwidths and fast synthesizers combine to yield short measurement times and thus high throughput in manual adjustments and automated production sequences. The measurement time per test point is less than 3.5 μ s in the CW mode; a frequency sweep over 200 test points takes less than 5 ms.

Due to the analyzer's wide dynamic range and low phase noise, this speed advantage does not compromise measurement accuracy.

Fast switching between instrument setups

When analyzing two or more DUTs, you no longer have to load the required instrument setups from the hard disk one after the other. Once called, setups remain available in RAM, including calculated data, e.g. calibration values obtained by interpolation. You can therefore switch between setups virtually without delay, i.e. in less than 10 ms by remote control. With conventional instruments, recalling setups can take up to one second. Each setup is represented by a separate measurement window.

This design feature also makes it easier to handle large volumes of measured data. If a display area becomes too "crowded", data can easily be distributed to other windows (setups). You can switch between windows by using the mouse or pressing a key.

Segmented sweep for optimized speed, accuracy and dynamic range

The segmented sweep function allows you to divide a sweep into a virtually unlimited number of segments. Sweep parameters such as test point spacing, measurement bandwidth, and generator power can be defined separately for each segment and accurately matched to the DUT characteristic. Measurement speed and accuracy can thus be further optimized.

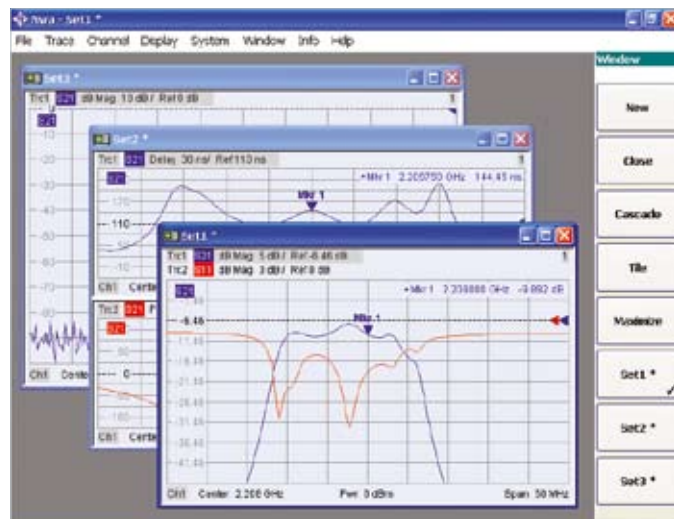

Parallel measurements – up to four times faster

In addition to the standard operating mode, the concept of the R&S®ZVA allows test ports to be organized in groups, e.g. in two groups of two ports each, or in four groups of one port each. Measurements are carried out on the various groups simultaneously, provided the test parameters are identical for each group. This means that measuring two or more DUTs in the parallel mode takes no more time than measuring a single DUT in the standard mode. Compared to sequential measurements, measurement speed will therefore double when measuring two two-port DUTs in parallel and quadruple when measuring four one-port DUTs in parallel.

Dynamic range between test ports at 10 Hz IF bandwidth.

Switching between setups at the click of a mouse.

Data transfer simultaneously with sweep

Since trace data is transferred via the IEC/IEEE bus or LAN at the same time measured data is being captured, data transfer time on the R&S®ZVA is insignificant.

Channel bits and user port – high-speed control of external devices

To speed up automatic test cycles even further, a special port for trigger I/O signals and status indication is provided on the rear panel. These signals directly synchronize external devices of a test setup or the settings of a DUT with the internal measurement sequences of the R&S®ZVA. No remote control sequences are required, which saves execution time. The pins of the USER CONTROL port also provide information on the net time required for measuring one point, one sweep, or carrying out a partial measurement. This makes it easy to determine net measurement times and optimize synchronization.

Parallel measurements

The test signals are applied to the DUTs simultaneously, and measurements are also carried out simultaneously. Compared to the standard (sequential) mode, measurement throughput is doubled with the test configuration shown [here](#).

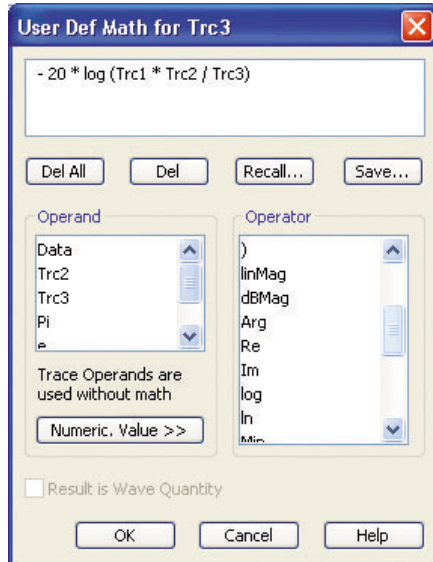

Ergonomic user interface

State-of-the-art DUTs feature a steadily increasing number of complex functions and ports, which also places higher demands on the instrument's display capabilities. The R&S®ZVA provides highly versatile functions for displaying results in a straightforward manner.

Virtually unlimited number of channels and traces

Over 100 traces can be combined in any manner within the individual diagrams and assigned to over 100 different channels. DUTs can thus be measured using a wide variety of stimulus conditions, and all parameters of interest can be displayed on the screen. The names of traces, channels, and markers can be edited and replaced by user-specific names to make them easier to identify.

Equation editor.

Easy export and import of results

The use of the Windows XP Embedded operating system, in conjunction with a variety of interfaces, makes it easy to integrate measurement results into documentation by saving screen contents as *.bmp, *.png, *.jpg, or *.emf files, and exporting these files to a text processing system. Trace data can be stored as *.snp, *.csv, or *.dat files and subsequently analyzed and processed using other tools. In addition, *.snp and *.csv files created by means of external tools, for example, can be imported into the R&S®ZVA as stored trace data.

Convenient equation editor for complex trace mathematics

The R&S®ZVA includes a universal equation editor for trace mathematics including even extensive functions. Using these functions, you can link any active traces and stored traces in a variety of ways in realtime. This makes external analysis programs unnecessary. You can store the equations you have generated, process them by means of external tools, and reload them as required.

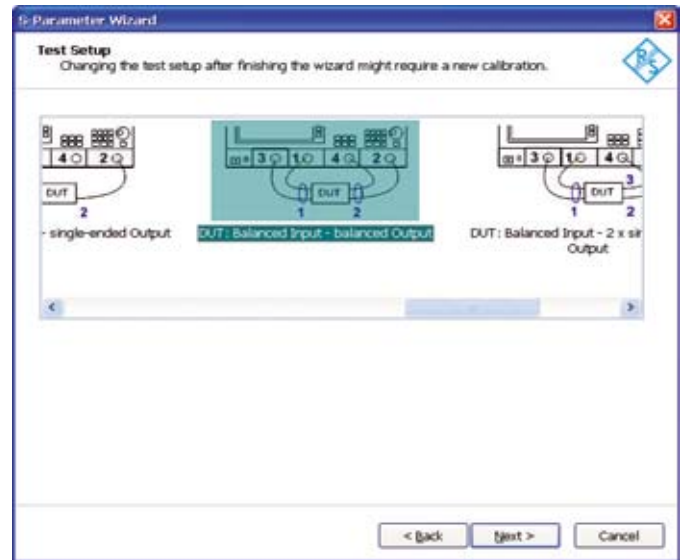

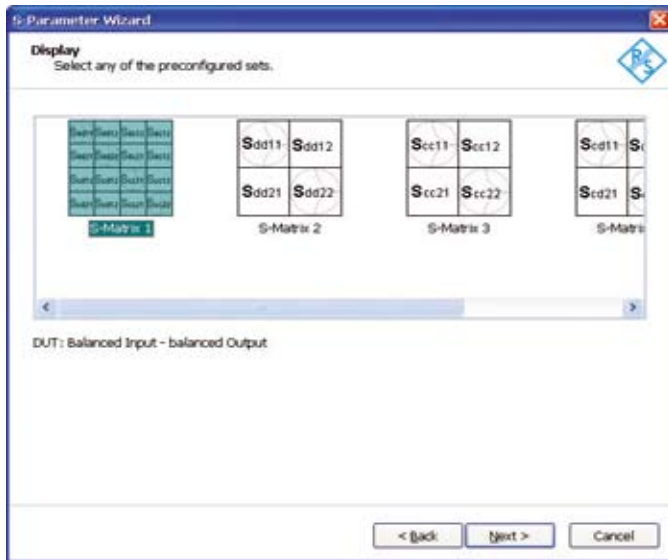

Flexible channel and trace layout.

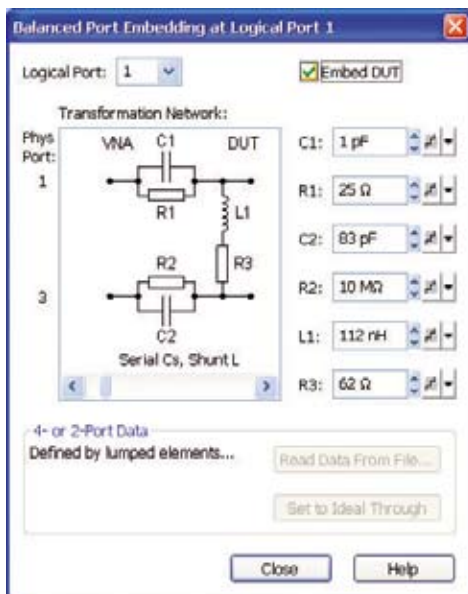

Measurement wizard – step by step to the test setup you want

Measuring multiports and balanced DUTs by means of a network analyzer usually requires major configuration effort on the part of the user, for example for configuring the port topology, selecting the parameters to be displayed, setting the sweep mode, or choosing the appropriate calibration technique. With the R&S®ZVA, a measurement wizard guides you step by step through the test setup to create the configuration you want, queries all necessary inputs and offers default settings for the measurement task at hand. Using the wizard, you can completely configure the R&S®ZVA to display all 16 mixed-mode S-parameters of a balanced two-port in virtually no time.

Typical configuration steps with the measurement wizard.

Parameterizable network for virtual impedance matching.

Embedding/deembedding – impedance matching using virtual networks

Coaxial and balanced components such as SAW filters, which are used in frontends of mobile phones, for example, must be specified together with the networks that match them to the impedance of the surrounding circuit. In addition, parasitic effects, which occur when the DUT is installed in its operational environment, can be simulated. Using special algorithms, the R&S®ZVA embeds the DUT in virtual matching networks, and also deembeds it to eliminate parasitic effects such as caused by strip lines.

The R&S®ZVA offers various types of transformation networks. The values of the network elements can be edited. If you modify values of individual elements, the R&S®ZVA immediately recalculates the network and (de)embeds the DUT in the new network in quasi-realtime.

Alternatively, you can read *.s2p and *.s4p files generated with CAE tools into the R&S®ZVA and use the data for embedding/deembedding.

Easy and error-free calibration

Versatile calibration techniques for all fields of application

The R&S®ZVA not only offers classic TOSM calibration (**T**hrough, **O**pen, **S**hort, **M**atch), but also a variety of other calibration techniques. Since each test port of the R&S®ZVA is equipped with a reference receiver of its own, modern seven-term calibration techniques can be used. These include TRL/LRL (**T**hrough, **R**eflect, **L**ine/ **L**ine, **R**eflect, **L**ine), TOM (**T**hrough, **O**pen, **M**atch), TNA (**T**hrough, **N**etwork, **A**ttenuator), and TRM (**T**hrough, **R**eflect, **M**atch), which are suitable for calibration in test fixtures or on wafers. Since calibration is performed directly on the DUT plane, any effects from the test fixture are eliminated.

Automatic calibration – fast, error-free, and with high precision

While all manual calibration techniques such as TOSM, TRM, and TRL can be used for multiport measurements, they are time-consuming, error-prone, and lead to excessive wear of the calibration standard. Rohde&Schwarz offers an automatic calibration unit for coaxial one-port and multiport calibration. The unit is ready to operate immediately after being connected and performs complete four-port calibration covering 201 test points in less than 30 seconds.

The R&S®ZVA allows for any combination between the analyzer's test port connectors and the connectors of the calibration unit. The analyzer detects the connections automatically. Errors due to wrong connections are a thing of the past.

The R&S®ZVA's firmware now also allows the recharacterization of calibration units by the user. Moreover, it is possible to characterize a calibration unit together with an adapter of any type. By treating the adapter as part of the calibration unit, the R&S®ZVA supports any combination of any connector types, which means that the calibration unit itself can be equipped with up to four different connectors. User-specific adapters can also be placed on the connectors of the calibration unit, which protects the connectors against wear.

Adapter removal functionality

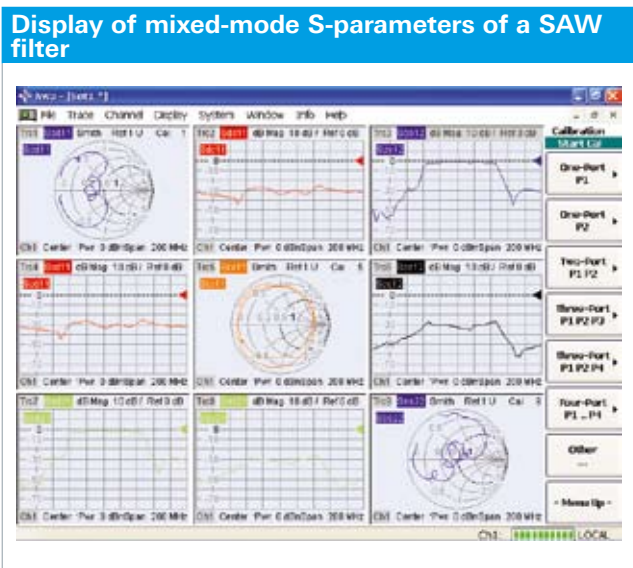

The UOSM (**U**nknown Through, **O**pen, **S**hort, **M**atch) calibration technique allows a through-connection with unknown parameters to be used as a calibration standard. This makes it possible to use any adapter with any types of connectors as a "U" (adapter removal functionality), thus supporting calibration of a DUT with different connector types.

Calibration unit.

Quick and reliable measurements on multiports and balanced components

A configuration wizard configures all 9 or 16 S-parameters at a few keystrokes.

Output signals of two R&S®ZVA ports in true differential mode (measured with an oscilloscope) using stimulus signals with 0° or 180° phase difference.

Virtual differential measurement mode

The R&S®ZVA characterizes balanced DUTs with one or two balanced ports quickly and accurately. The balanced DUT is directly connected to the analyzer test ports. Its unbalanced S-parameters are measured, and the mixed-mode S-parameters are calculated from these values.

The numerous traces and diagrams offered by the R&S®ZVA provide full characterization of the DUT and straightforward display of all measurement quantities. No sophisticated settings are required on the part of the user. Convenient marker search and analysis functions facilitate result evaluation especially in the case of filter measurements, for example by determining the filter parameters such as bandwidth, ripple, quality factor, etc.

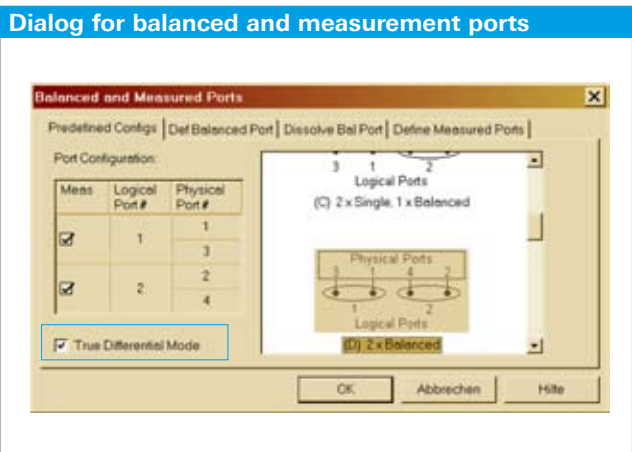

True differential measurement mode

Active components in particular may show a distinctly different response to a stimulus signal, depending on whether the virtual (standard) or the true differential measurement mode is applied.

To obtain reliable results even for active differential DUTs, the R&S®ZVA-K6 option provides true differential stimulation and measurements. The test signals delivered by the two internal generators are applied at the reference plane simultaneously with 0° or 180° phase difference. The measurements on the selected test ports are performed simultaneously. The R&S®ZVA-K6 option also supports true phase imbalance and true amplitude imbalance sweeps of the two stimulus signals.

As with standard measurements, calibration is performed either manually using a calibration kit, or automatically with a calibration unit.

Dialog for configuring a balanced measurement: The true differential mode is selected at a single mouse click.

Linear and nonlinear amplifier and mixer measurements

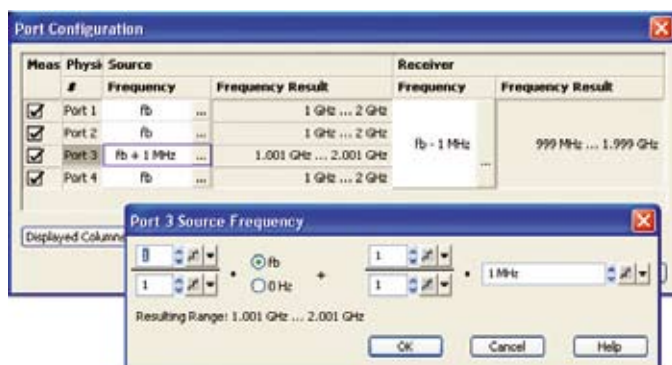

The R&S®ZVA system concept, featuring independent synthesizers, enables measurements on amplifiers and frequency-converting DUTs such as mixers and frontends. The measurements stand out for their high versatility, wide dynamic range, high speed, and accuracy.

Internal as well as several external generators can be configured, calibrated, and controlled independently of one another. The high spectral purity of the source signals as well as the high intercept point and high sensitivity of the receivers eliminate the need for external filters in multitone measurements and measurements on frequency-converting DUTs.

Large- and small-signal behavior in a single sweep

The R&S®ZVA's high output power and wide power sweep range of more than 50 dB (typ. 60 dB) allow the transmission and compression characteristics of amplifiers and mixers to be determined largely without any additional preamplifiers being required. This measurement is carried out simply and quickly versus frequency and power. The power sweep range is traversed wear-free and without interruption since no mechanical attenuators have to be switched. Small- and large-signal behavior can thus be displayed in a single sweep.

Dialog for configuring multitone measurements.

Simultaneous measurement of noise figure and S-parameters

The R&S®ZVA receiver architecture, which includes an average and an RMS detector, makes it possible to measure the noise figure and the S-parameters of an amplifier simultaneously without having to modify any connections on the DUT. The method requires neither a noise source nor an impedance tuner; all that is needed is a power meter for calibration. This simplifies the test setup and reduces measurement and operator errors.

Second internal source for quick and easy intermodulation and mixer measurements

The R&S®ZVA four-port model provides a second independent source; therefore, intermodulation measurements on amplifiers and conversion gain measurements on mixers can be performed without an external generator. The R&S®ZVA receivers feature very good power-handling capability and low phase noise, which enables high-quality intermodulation measurements requiring only a minimum of external components.

Intermodulation products of a frontend.

Test setup for a mixer measurement

Hot S-parameter measurements – optimization of amplifiers under load conditions

Power amplifiers must be characterized under full load condition to ensure that they are optimally matched to the load connected to their output. To determine S_{22} under realistic operating conditions, a stimulating signal is applied to the amplifier input. A low-power signal – which is the actual S_{22} test signal – is applied to the amplifier output (i.e. in the reverse direction). To separate the high-power output signal of the amplifier from the reflected low-power signal, the two sources are swept in parallel, but with a small frequency offset. Only the desired S_{22} measurement signal passes the IF filter. The R&S®ZVA performs this measurement with a wide dynamic range and using the high selectivity and sensitivity of its receivers.

Conversion gain and intermodulation measurements on mixers at high speed and with wide dynamic range

The four-port R&S®ZVA requires only one additional external source to perform intermodulation measurements on mixers. The external source is controlled via the analyzer's LAN or IEC/IEEE bus interface. Using the frequency conversion option (R&S®ZVA-K4), you can display a mixer's matching, conversion gain, isolation, group delay, and intermodulation products versus frequency and power.

Absolute phase measurements on mixers

Any mixer-based receiver system requires that the built-in mixers have well-controlled amplitude, phase, and group delay responses. The R&S®ZVA-K5 option makes it possible to characterize all four complex S-parameters of a mixer with LO access, including absolute phase and group delay of the conversion loss. This measurement uses full two-port calibration, which yields high measurement accuracy.

Group delay measurement on converters without LO access

The R&S®ZVA offers a new technique for measuring the group delay and relative phase of frequency converters without access to the embedded local oscillator or its reference signal. This method requires a four-port R&S®ZVA with two sources to apply a two-tone signal to the converter. The R&S®ZVA evaluates the group delay by measuring the phase differences between both carriers at the input and the output of the DUT. Frequency drift or even frequency modulation of the internal LO does not affect the measurement result as long as the frequency deviation is within the measurement bandwidth of the R&S®ZVA.

Test setup for scalar mixer measurement**Power measurements and scalar network analysis by means of the R&S®NRP**

One or more power meters of the R&S®NRP series can be directly connected to the R&S®ZVA via the USB interface or by using an active USB hub. The power meters are treated by the R&S®ZVA like additional test ports. The R&S®ZVA processes the measured values and displays them as traces versus frequency or power. Besides adding power measurement inputs to the R&S®ZVA, this functionality allows measurements on frequency-converting DUTs to be performed without access to, or knowledge of, the DUT's internal LO, in the same way as with a scalar network analyzer.

Feature overview**Features for amplifier measurements**

- Bias-tees at all test ports
- High output power at all test ports
- Wide power sweep range
- High 0.1 dB compression point
- RMS and peak detector
- Determination of n-dB compression point
- Second independent source (four-port model) for intermodulation measurements
- Power added efficiency (PAE) measurement
- Measurement of efficiency and stability factors
- DC inputs for measuring supply currents and power detector characteristics
- Intermodulation measurement versus frequency and power (R&S®ZVA-K4)
- Hot S-parameter measurements (R&S®ZVA-K4)
- Generator and receiver step attenuators for expanding the usable power range (R&S®ZVA-B2x/-B3x)
- Power measurement with the R&S®NRP power meter
- Measurements on pulsed signals (average pulse, point-in-pulse, pulse profile, R&S®ZVA-K7/-B7)
- Noise figure measurements (R&S®ZVAB-K30)

Features for mixer measurements

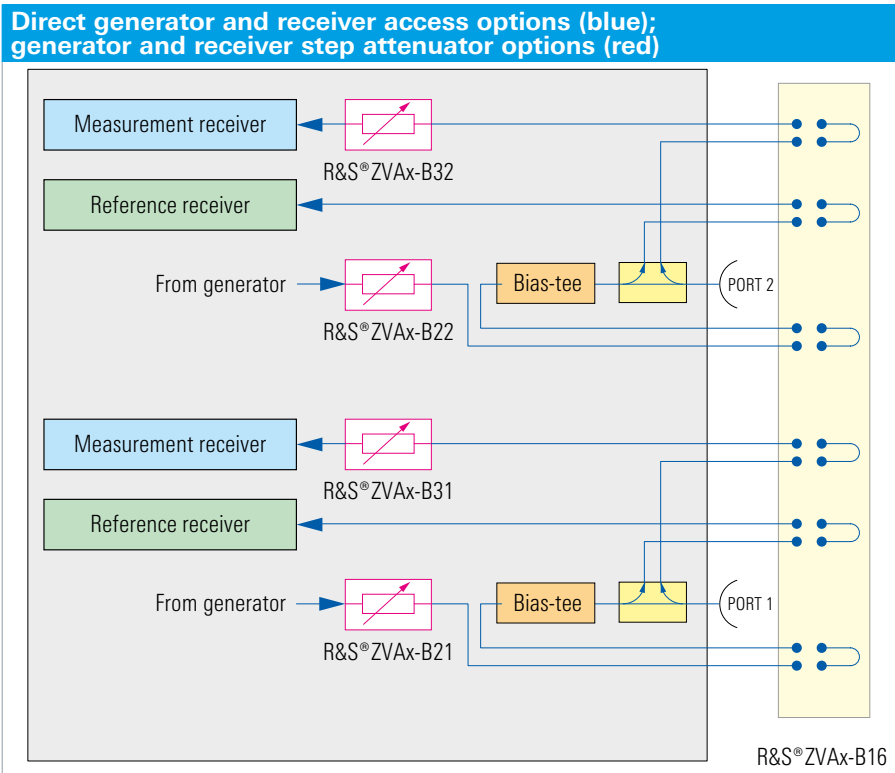

- Conversion loss/gain, compression, intermodulation, isolation, and matching measurements versus frequency and power (R&S®ZVA-K4)
- Relative phase and group delay measurements on mixers with LO access (R&S®ZVA-K4)
- Magnitude, absolute phase and group delay measurements of conversion loss of mixers with LO access (R&S®ZVA-K4, R&S®ZVA-K5, R&S®ZVA-B16). The measurements are vector-error-corrected and thus very accurate
- Absolute group delay and relative phase measurements on converters without LO access (R&S®ZVA-K4, R&S®ZVA-K9, R&S®ZVA-B16)
- Second internal source available as LO for conversion gain measurements
- Control of external generators from Rohde&Schwarz and other manufacturers
- Editable ASCII driver file for creating customized drivers for SCPI-compatible instruments
- Scalar network analysis by means of the R&S®NRP power meter

Options to enhance flexibility, power, and dynamic range

Direct generator and receiver access for all ports

With the direct generator/receiver access options, the signal paths of the receivers and generators are taken directly to the front panel. You have direct access to the generators and receivers of all reflectometers, since the internal couplers are bypassed. With a fully configured R&S®ZVA, i.e. with four ports, all eight receivers can capture and process measurement data in parallel.

Generator and receiver step attenuators are optionally available for each port to expand the usable generator and receiver power ranges for compression and intermodulation measurements. The output power range at the test port can be decreased down to < -100 dBm; the compression-free input power range of the receiver will increase to $+27$ dBm.

Typical dynamic range with direct receiver access.

Up to 150 dB dynamic range with direct receiver access

Since the couplers are bypassed and therefore introduce no attenuation, sensitivity is increased by up to 10 dB in the direct mode. This means that high-blocking DUTs can be measured with a dynamic range of up to 150 dB at 1 Hz IF bandwidth.

By connecting suitable external directional couplers, one- and two-port calibration techniques can be used to enhance measurement accuracy without any significant loss in dynamic range.

Output power boosted to +30 dBm for amplifier measurements

Direct access to all generator and receiver paths allows the flexible configuration of complex external test sets. Such test sets may include filters for improved harmonic suppression or amplifiers for boosting the output power. The output power can be increased to +30 dBm by looping a preamplifier into the generator path and inserting suitable attenuators in the measurement and reference paths.

Connecting external components (e.g. amplifiers) ahead of the reference path eliminates drift and temperature response in S-parameter measurements. Moreover, all calibration techniques are available, and the user fully benefits from the advantages of high measurement accuracy and long-term stability.

High-speed time domain analysis with enhanced resolution capability

Using the time domain option, you can, for example, locate discontinuities in test fixtures and cables and analyze them, e.g. by means of a gated S-parameter measurement. You can display impedance versus length, which is of interest in cable measurements. Due to the R&S®ZVA's high computing power, the time domain option barely slows down sweep speed. Thus, this option allows cavity resonator filters to be adjusted quickly and easily.

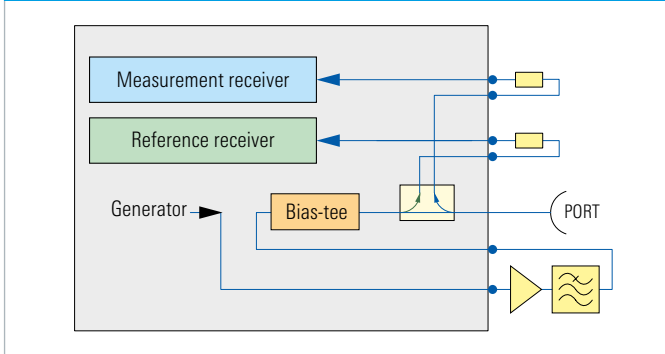

The time domain option can be used in conjunction with various window functions such as Hamming, Hann, Bohman, or Dolph-Chebyshev.

With conventional TDR methods, the resolution, i.e. the width of reflected-signal peaks and the rise time of step responses, is limited by the network analyzer's frequency range. The R&S®ZVA does away with this limitation. Its linear prediction function expands the frequency spectrum by way of computation. Using this function, you can analyze considerably finer structures than was previously possible due to the limitation to the analyzer's actual frequency range. This function also allows narrowband and frequency-limited DUTs to be measured with higher accuracy.

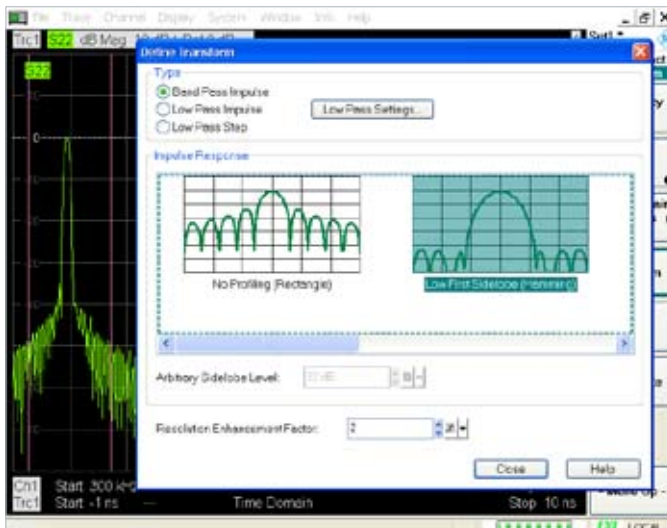

5 MHz receiver bandwidth

The R&S®ZVA has a maximum IF bandwidth of 1 MHz as standard. To reduce measurement times even further, the R&S®ZVA-K17 software option offers IF bandwidths up to 5 MHz. This reduces the net sampling time per point to approx. 430 ns. The option not only speeds up measurements in the frequency domain. It also provides improved performance for point-in-pulse and pulse profile measurements on pulses of a few microseconds' length by means of easy-to-configure standard CW or time sweeps, where the S-parameters or amplitudes of pulses are measured as a function of time.

The R&S®ZVA with external test set including an amplifier and a harmonic filter.

Dialog for time domain measurement configuration.

Convenient handling of pulse profile measurements

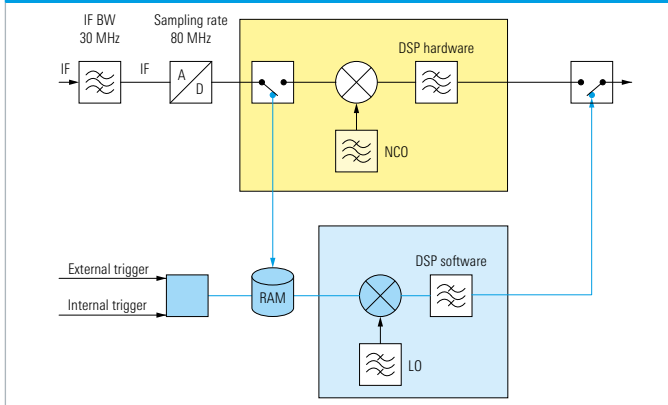

The R&S®ZVA performs typical pulsed measurements such as point-in-pulse or high-PRF-mode measurements by means of the direct generator/receiver access option. The R&S®ZVA-K7 and R&S®ZVA-B7 pulsed measurements options provide a convenient, high-performance solution especially for pulse profile measurements: Even the profiles of very short pulses with a duration far below 100 ns are represented with a resolution of 12.5 ns in the time domain. Traces are updated at a high rate, which greatly facilitates adjustment procedures.

The R&S®ZVA displays amplitude characteristics (the powers measured in the measurement and the reference channels, and their ratios), as well as S-parameters in magnitude and phase. Single pulses, double pulses, or pulse trains up to 3 ms length (R&S®ZVA-K7) or 25 ms length (R&S®ZVA-B7) can easily be measured. The options include methods for compensating the group delay of the DUT, which makes it possible to measure pulses whose length is shorter than the group delay of the DUT. IF bandwidths up to 30 MHz are available for short pulses.

Principle of pulse profile measurements

The A/D converter outputs uncorrected sampling values, which are first stored in a high-speed buffer (RAM), and then digitally processed block by block by the software (see blue arrows in block diagram). Therefore, with sampling performed independently of signal processing, the pulse signal can be sampled at the converter's maximum rate of 80 MHz.

Principle of pulse profile measurement

Pulse profile measurement; input power, output power, and S-parameter

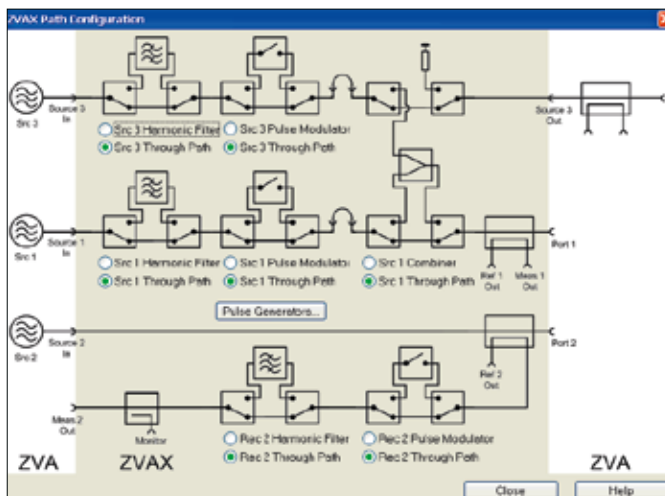

Measurements on active devices made easy

Setup for S-parameter, harmonic, intermodulation and pulsed measurements

Convenient control via a graphical user interface.

The R&S®ZVAX24 extension unit for the R&S®ZVA simplifies advanced measurements on active devices such as amplifiers. Depending on the measurement tasks, it can be configured with combiners, harmonic filters, pulse modulators or high-power couplers. It is directly controlled by the R&S®ZVA via a graphical user interface.

The combination of an R&S®ZVA and the R&S®ZVAX24 behaves like a fully integrated single box. However, if multiple R&S®ZVAs are being used in a lab, they can share the extension unit. This leads to an optimum utilization of investment.

Combiner for fast and accurate IMD measurements

An internal combiner provides a two-tone signal, using both sources of a four-port R&S®ZVA or a two-port R&S®ZVA with an external generator. Together with the R&S®ZVA's intermodulation wizard, it simplifies the setup for measuring the intermodulation parameters versus frequency and power.

Pulse modulators for all pulsed RF applications

Two pulse modulators in the source paths allow pulsed measurements on TX/RX modules, amplifiers, and mixers. A third modulator in the receiver path allows gating of the receiver to prevent compression caused by crosstalk, e.g. for pulsed RCS measurements. Two pulse generators in the R&S®ZVA control the modulators.

Harmonic filters for spurious and harmonic testing

Two harmonic filters in the source paths improve the spectral purity of the generator signal. An additional harmonic filter in the receiver path extends the dynamic range for harmonic and spurious testing.

Couplers for monitoring and high-power applications

A coupler in the measurement path allows parallel monitoring of the measurement signal of port 2 of the R&S®ZVA, e.g. by means of a spectrum analyzer. Two high-power couplers of the R&S®ZVA are installed to handle power levels up to 43 dBm.

Interface description

PORT BIAS

DC power input for supply of amplifiers via inner conductor of test port; one input and fuse per RF port; BNC connectors

IEC BUS

Remote control of the R&S®ZVA

MONITOR

For external VGA monitor; standard VGA connector

EXT TRIGGER

Input of external TTL trigger signal for starting a sweep, sweep segment, test point, or partial measurement; BNC connector

LAN 1

Control of the R&S®ZVA or a subnetwork with the R&S®ZVA as the master, 8-pin RJ-45 connector

LAN 2

Control of the R&S®ZVA or a subnetwork with the R&S®ZVA as the master, 8-pin RJ-45 connector

USB

Standard 1.1 USB double port (for mouse, keyboard, printer, storage media, etc.)

DC MEAS

Measurement inputs for DC voltage and PAE measurements; input voltage ranges ± 1 V and ± 10 V; mini DIN connectors; required cable: R&S®ZV-Z71 (option)

10 MHz REF

Reference frequency I/O: 10 MHz reference can be input from, or output to, external devices; BNC connector

USER CONTROL

TTL I/O signals: sweep status indication, pass/fail indication, indication of active test port, indication of active channel by channel bits, trigger signals for fast control of external devices, e.g. generators, handshake with handlers, sequence control without programming effort; 25-pin D-Sub connector

Technologies

Standard functions

Function	Description
Two or four test ports, one generator for each pair of test ports	Integrated bidirectional RF test ports; test set configuration depends on analyzer model and is provided as standard in each case
Measured quantities	Complete S-parameter matrix, wave quantities, wave quantity ratios, impedances, admittances, Z- and Y-parameters of multiport DUTs, stability factors
Balanced measurements (standard mode)	Mixed-mode S-parameters, mixed-mode Z- and Y-parameters, impedances and admittances of balanced DUTs
Pulsed measurements	High PRF mode, point-in-pulse, pulse profile measurements with pulse duration of approx. 10 µs to 100 µs and longer, by means of CW or time sweep; use of the R&S®ZVAxy-B16 and R&S®ZVA-K4 options recommended
Calibration techniques	TOSM, TRL/LRL, TOM, TRM, TNA, normalization, one-path two-port; UOSM for calibration with an unknown through-connection (includes adapter removal function); automatic calibration (R&S®ZV-Z51/-Z52/-Z53/-Z54)
Power calibration	Enhanced power accuracy; calibration of test sets and preamplifiers; for frequency and power sweeps; requires an external power meter; maximum convenience with the R&S®NRP power sensors with USB interface
Power measurement and scalar network analysis	R&S®NRP power sensors can be connected directly to the USB ports and are treated like additional test inputs; display of power versus frequency or versus power; enables wideband scalar network analysis
Automatic level control (ALC)	Controls the output power by means of the signal fed to the reference channel; corrects preamplifier drift as well as power uncertainty due to mismatch; provides enhanced power accuracy and linearity
Active test set (PORT BIAS)	Input of DC power for supply of amplifiers via inner conductor of test port; requires external DC power supply
DC inputs	Measurement inputs for DC voltage, enabling PAE measurements
User support for calibration	Calibration manager; performance of selective calibration steps instead of complete recalibration; definition of calibration kits by means of equivalent circuit model or using S-parameters of calibration standards
Large number of diagrams, traces, and channels	More than 100 traces and channels can be created and assigned to diagrams as required
Preloading of setups; setup swap	Simultaneous loading of several instrument setups into RAM; fast switchover between instrument setups, manually or by IEC/IEEE bus control
Segmented sweep, lin/log sweep	Optimization of sweeps for important DUT measurement parameters
Power sweep, compression measurements	50 dB power sweep range for compression measurements
CW mode	Sweeps with fixed power and frequency; shortest measurement time less than 3.5 µs per test point; for measuring pulsed components or settling times
Time sweep	Determination of measured quantities as a function of time
60001 points per trace (100001 points on request)	High sweep resolution, narrow test point grid
IF bandwidths 1 Hz to 1 MHz	Optimization of measurement speed and dynamic range
Online support functions	Context-sensitive online help; UNDO function for canceling the last user operations; Windows XP key for accessing the operating system; complete listing of current instrument setup including calibration
User guidance	Step-by-step guidance to desired instrument setup, including calibration if required (measurement wizard)
Convenient execution of control software	Execution of macros, as well as control or analysis programs, at a keystroke
Trace mathematics, equation editor	Functions for online computation of measured data using complex equations, for adjustments and for statistical evaluation (RMS, Max Hold, etc.)
Marker functions, trace statistics, limit lines	Ten markers per trace, individually configurable; comprehensive analysis functions and online trace data evaluation; generation of limit lines from traces, data import and export for limit lines
Trigger functions	Triggers for sweeps, sweep segments, test points, or partial measurements
Interfaces (2 × LAN, 4 × USB, IEC BUS, MHZ REF, MONITOR, USER CONTROL, DIGITAL INTERFACE, EXT TRIGGER)	Control of the R&S®ZVA; control of external devices or handlers by means of the R&S®ZVA; fast TTL handler and sequence control; connection of peripherals, e.g. printer or storage media (see also interface description); indication of measurement time
Embedding/deembedding	Inclusion of virtual matching networks, parasitic effects, etc.; correction of the influence of test set components; parameterizable predefined networks and/or import of S-parameter files in order to define (matching) networks
Adapter removal	Enables calibration using different types of connectors in the reference planes, e.g. N ↔ 3.5 mm; this function is possible by applying the UOSM calibration technique, which allows an adapter with unknown parameters to be used as a through-connection ("Unknown Through"); O, S, and M calibration is required for the different connector types at both ends

Technologies

Options

Designation	Type	Function
Oven Quartz (OCXO)	R&S®ZVAB-B4	Enhanced frequency accuracy
Time Domain (TDR)	R&S®ZVAB-K2	Location of discontinuities or determination of impedance characteristic versus time/length, reflection and transmission measurements, gating function for eliminating discontinuities, linear prediction function for enhanced resolution
Generator Step Attenuator for Port 1/2/3/4	R&S®ZVA8-B21/22/23/24 R&S®ZVA24-B21/22/23/24 R&S®ZVA40-B21/22/23/24 R&S®ZVA50-B21/22/23/24 R&S®ZVA67-B21/22	Generator step attenuators 70 dB in steps of 10 dB; $P_{\min} = < -100$ dBm (R&S®ZVA8, R&S®ZVA24, R&S®ZVA40) 50 dB in steps of 10 dB; $P_{\min} = < -80$ dBm (R&S®ZVA50, R&S®ZVA67)
Receiver Step Attenuator for Port 1/2/3/4	R&S®ZVA8-B31/32/33/34 R&S®ZVA24-B31/32/33/34 R&S®ZVA40-B31/32/33/34 R&S®ZVA50-B31/32/33/34 R&S®ZVA67-B31/32	Receiver step attenuators 35 dB in steps of 5 dB; $P_{\max} = 27$ dBm
Direct Generator/Receiver Access (all ports), Two-/Four-Port Model	R&S®ZVA8-B16 R&S®ZVA24-B16 R&S®ZVA40-B16 R&S®ZVA50-B16 R&S®ZVA67-B16	Direct access to the R&S®ZVA internal generators and receivers for all ports of the analyzer (internal couplers are bypassed)
Frequency Conversion	R&S®ZVA-K4	Measurements on frequency-converting DUTs: conversion gain, harmonics, hot S_{22} and intermodulation measurements on mixers and amplifiers; Requires R&S®ZVAB-B44 or VISA I/O BIB to control external generators
Vector Corrected Mixer Measurements	R&S®ZVA-K5	Measurement of absolute phase and group delay of mixers with access to the LO; requires R&S®ZVA-B16 and R&S®ZVA-K4
Embedded LO Mixer Delay Measurements	R&S®ZVA-K9	Measurement of group delay and relative phase of frequency converters without access to the internal LO; requires the R&S®ZVA four-port model, R&S®ZVA-K4 and R&S®ZVA-B16
Cable Set for R&S®ZVA-K9	R&S®ZVA-B9	Set of cables for the R&S®ZVA-K9 to use the internal coupler of R&S®ZVA to generate the two-tone signal
5 MHz Receiver Bandwidth	R&S®ZVA-K17	Offers up to 5 MHz IF bandwidth, thus providing shorter measurement times for frequency, time, or CW sweeps; enhanced performance for point-in-pulse measurements
Pulsed Measurements	R&S®ZVA-K7	Enables pulse profile measurements: up to 3 ms recording of pulse profile versus time with 12.5 ns resolution; measurement of magnitude and phase of S-parameters; offers up to 30 MHz IF bandwidth; includes R&S®ZVA-K17
Pulsed Measurements	R&S®ZVA-B7	Enables pulse profile measurements: up to 25 ms recording of pulse profile versus time with 12.5 ns resolution; includes R&S®ZVA-K7
Internal Pulse Generators	R&S®ZVA-K27	Two pulse generators, e.g. for controlling the pulse modulators of the R&S®ZVAX24; generation of single pulses, double pulses and pulse trains
True Differential Measurements	R&S®ZVA-K6	Stimulation of balanced devices using true 0° and 180° phase-locked differential signals supplied by the two internal generators of the R&S®ZVA four-port model; measures mixed-mode S-parameters, phase, etc.; supports -180° to +180° true phase and amplitude imbalance sweeps of the stimulus signals
USB-to-IEC/IEEE Adapter	R&S®ZVAB-B44	Adapter and driver software for controlling external generators by means of the R&S®ZVA via the GPIB interface; required, for example, for use with the R&S®ZVA-K4 frequency conversion option
Visa I/O Library	VISA I/O BIB	Software library for controlling external generators by means of the R&S®ZVA via the LAN interface; required, for example, for use with the R&S®ZVA-K4 frequency conversion option
External Attenuator Control	R&S® ZVA-B8	Control of the electronic attenuators of R&S®ZV-Z110E converter, e.g. for accurate power leveling after power calibration or for performing power sweeps
Converter, 50 GHz to 75 GHz 75 GHz to 110 GHz 220 GHz to 325 GHz	R&S®ZVA-Z75 R&S®ZVA-Z110/E R&S®ZVA-Z325	Converts the frequency range of an R&S®ZVA24, R&S®ZVA40, R&S®ZVA50 or R&S®ZVA67 vector network analyzer to frequency ranges up to 325 GHz. One or more external converters may be required. Bidirectional measurements on two-port DUTs, for example, require two converters. Additional requirements: cable sets, waveguide calibration kits, R&S®ZVA-K8 converter control software (for details refer to the R&S®ZVA-Z75/110/325 data sheet)
Extension Unit	R&S®ZVAX24	External box that can be equipped with options such as combiner, pulse modulators, harmonic filters and high-power couplers to perform harmonic, intermodulation, high-power and pulsed measurements with the R&S®ZVA
Noise Figure Measurements	R&S®ZVAB-K30	Measures the noise figure of an amplifier simultaneously with its S-parameters or any other quantities without having to modify any connections on the DUT. Requires a power meter for calibration, e.g. the R&S®NRP.

2.92 mm (f)/2.92 mm (m), 0.6 m/0.9 m	R&S®ZV-Z195	0 Hz to 40 GHz	1306.4536.24/36
Sliding Matches			
N (m), 50	R&S®ZV-Z41	1.7 GHz to 18 GHz	1085.8095.02
N (f), 50	R&S®ZV-Z41	1.7 GHz to 18 GHz	1085.8095.03
3.5 mm (m/f pair)	R&S®ZV-Z42	2 GHz to 26.5 GHz	1128.3524.02
2.92 mm (m/f pair)	R&S®ZV-Z44	4 GHz to 40 GHz	1128.3553.02
Hardware and measurement add-ons			
USB Keyboard	R&S®PSL-Z2		1157.6870.04
USB Mouse	R&S®PSL-Z10		1157.7060.03
Cable for DC Input	R&S®ZV-Z71		1164.1005.02
19" Rack Adapter	R&S®ZZA-611		1096.3302.00
Removable Flash Disk (for FMR6/5) ¹⁵⁾	R&S®ZVAB-B18		1164.0715.02
2nd Removable Flash Disk	R&S®ZVAB-B19		1164.1111.02
Removable Flash Disk (for FMR7/3, FMR7/6)	R&S®ZVAB-B18		1164.0715.03
Upgrade Kit for Control Unit (FMR6/5 to FMR7/6) ¹⁵⁾	R&S®ZVx-U1		1305.4610.02
Upgrade Kit for Control Unit (FMR7/3 to FMR7/6) ¹⁵⁾	R&S®ZVAB-U76		1305.4610.04
Control Unit FMR7/6 ex factory	R&S®ZVAB-B76		1305.4610.03
Manual (in printed form)			1145.1084.12

¹⁾ Operating manual on CD ROM and quick start guide supplied with the R&S®ZVA.

²⁾ Requires R&S®ZVA-K8. In case an external generator is used for the LO signal, the R&S®ZVAB-B44 option is required for controlling via GPIB; the VISA I/O BIB option is required for controlling external generators via LAN.

³⁾ Requires R&S®ZVA-B8.

⁴⁾ Includes R&S®ZVA-K4.

⁵⁾ Control unit, installed in floppy drive slot. Required once per VNA.

⁶⁾ The R&S®ZVAB-B44 option is required for controlling external generators via GPIB; the VISA I/O BIB option is required for controlling external generators via LAN.

⁷⁾ Requires R&S®ZVA-B16 and R&S®ZVA-K4.

⁸⁾ Requires R&S®ZVA four-port model, R&S®ZVA-B16 and R&S®ZVA-K4; R&S®ZVA-K5 and R&S®ZVA-B9 recommended.

⁹⁾ R&S®ZVA-B16 recommended. Includes R&S®ZVA-K17.

¹⁰⁾ x = 2 for R&S®ZVA8, x = 3 for R&S®ZVA24 and R&S®ZVA40 2.92 mm, x = 4 for R&S®ZVA50 and R&S®ZVA67.

¹¹⁾ Requires R&S®ZVA four-port model.

¹²⁾ Requires R&S ZVA-B16.

¹³⁾ Requires R&S®ZVAX24.

¹⁴⁾ One cable.

¹⁵⁾ All R&S®ZVA analyzers are equipped as standard with an FMR7/3 control unit as of September 2007. The FMR7/6 control unit with higher performance can be installed optionally.

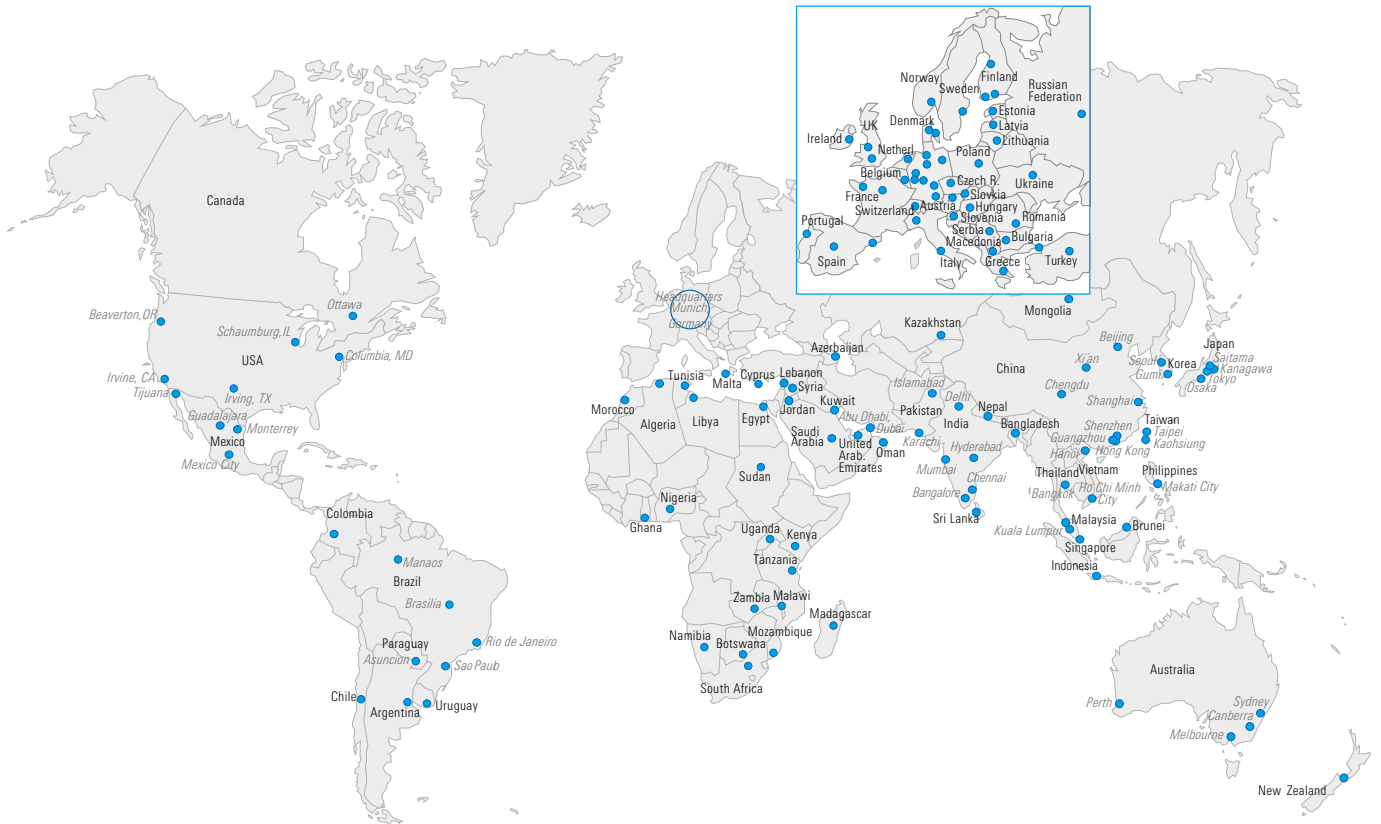

¹⁶⁾ A suitable preamplifier dependent on R&S®ZVA model and frequency range might be necessary.

Designation	Type	Order No.
Service options		
R&S®ZVA8		two-ports/four-ports
One-Year Repair Service following the warranty period	R&S®RO2ZVA8	1145.1110S36/46
Two-Year Repair Service following the warranty period	R&S®RO3ZVA8	1145.1110S32/42
Four-Year Repair Service following the warranty period	R&S®RO5ZVA8	1145.1110S34/44
Two-Year Calibration Service	R&S®CO2ZVA8	1145.1110S35/45
Three-Year Calibration Service	R&S®CO3ZVA8	1145.1110S31/41
Five-Year Calibration Service	R&S®CO5ZVA8	1145.1110S33/43
R&S®ZVA24		
One-Year Repair Service following the warranty period	R&S®RO2ZVA24	1145.1110S16/26
Two-Year Repair Service following the warranty period	R&S®RO3ZVA24	1145.1110S12/22
Four-Year Repair Service following the warranty period	R&S®RO5ZVA24	1145.1110S14/24
Two-Year Calibration Service	R&S®CO2ZVA24	1145.1110S15/25
Three-Year Calibration Service	R&S®CO3ZVA24	1145.1110S11/21
Five-Year Calibration Service	R&S®CO5ZVA24	1145.1110S13/23
R&S®ZVA40		
One-Year Repair Service following the warranty period	R&S®RO2ZVA40	1145.1110S56/66
Two-Year Repair Service following the warranty period	R&S®RO3ZVA40	1145.1110S52/62

Four-Year Repair Service following the warranty period	R&S®RO5ZVA67	1305.7002S14
Two-Year Calibration Service	R&S®CO2ZVA67	1305.7002S15
Three-Year Calibration Service	R&S®CO3ZVA67	1305.7002S11
Five-Year Calibration Service	R&S®CO5ZVA67	1305.7002S13

From pre-sale to
service. At your
doorstep.

The Rohde&Schwarz network in over 70 countries ensures optimum on-site support by highly qualified experts. The user risks are reduced to a minimum at all stages of the project:

- Solution finding/purchase
- Technical start-up/application development/integration
- Training
- Operation/calibration/repair

Service you can rely on

- Worldwide
- Local and personalized
- Customized and flexible
- Uncompromising quality
- Long-term dependability

About Rohde & Schwarz

Rohde & Schwarz is an independent group of companies specializing in electronics. It is a leading supplier of solutions in the fields of test and measurement, broadcasting, radiomonitoring and radiolocation, as well as secure communications. Established 75 years ago, Rohde & Schwarz has a global presence and a dedicated service network in over 70 countries. Company headquarters are in Munich, Germany.

Environmental commitment

- Energy-efficient products
- Continuous improvement in environmental sustainability
- ISO 14001-certified environmental management system
